

To Whom it May Concern,

Ethan Johnsrud was hired by Fasetto Inc. as an intern to work on projects to highlight and demo our Gravity Platform. Over the course of his employment and projects, he learned many new technologies and processes. The Gravity platform utilizes a multidevice experience, meaning it has multiple clients working with the applications all at the same time. This leads to some unique software but also unique challenges with programming and syncing. Ethan worked on two applications at Fasetto, Concept Environment and a Text Editor, to incorporate multiple users across the Gravity platform in real-time. Concept Environment allowed many clients to add ideas and comments to a graphical mind tree in real-time. Ethan incorporated specialized functionality into Concept Environment for version control, separate sessions on the within server, and offline data merging and syncing. To accomplish the software, Ethan learned and became familiar with many technologies including: React, JavaScript, Express, NodeJS, and Socket.IO.

Ethan was a fantastic person for us to have on board to create these applications. He has a lot of drive and motivation to learn new things on his own. Before he officially started, he took it upon himself to learn about NodeJS (something we used on Gravity) and the React framework. This meant he was prepared on his first day to learn the method and structure of our code base. The main objective of Gravity is to allow multiple clients to connect to the host running Gravity, then work and collaborate all at the same time. Ethan came up with a Neural Network Application, in which users started with an original idea, and then could expand and grow into more detailed concepts. Gravity was a perfect platform, for this sort of application. Ethan was able to get multiple users to collaborate at once with version control and sizing for multitude of different screen sizes.

I cannot recommend Ethan enough for a development position. He was professional, prompt, thorough, and driven to learn more. He fit in with our development team, and was not afraid to learn on his own, ask questions, and apply concepts.
